## MCPP TEST PROCEDURE

#### **OBJECTIVE:**

The primary objective of the Macrovision Certification Partnership Program (MCPP) Test Procedure is to allow Macrovision licensees the ability to submit computer product for certification with confidence that it will pass. The MCPP Test Procedure together with the Macrovision Training Video will provide all the information required to perform verification testing for Macrovision compliance.

## **EQUIPMENT REQUIRED:**

- Variable Video Distribution Amplifier (VDA)
- Sony Cross Pulse Monitor (Model PVM-14M4U or equivalent)
- Tektronix Waveform/Vector Scope (Model 1745 or equivalent)
- Macrovision Test Disc
- Macrovision Training Video
- MCPP Test Procedure (Revision 7.1.D1)
- DVD Player (used as a source of ACP during Security testing)
- Assorted and Appropriate Computer System Cables (S-video and Composite RCA type)

## **PROCEDURE OUTLINE:**

I. NTSC Interlaced Waveform Measurements

H-Sync Amplitude Normalization Procedure

Table 1 – Pseudo Sync Pulse Measurements (NTSC)

Table 2 – AGC Pulse Measurements (NTSC)

Table 3 – End of Field Back Porch Pulse Measurements (NTSC)

Table 4 – 2 Line Colorstripe Position Measurements

Table 5 - 4 Line Colorstripe Position Measurements

Table 6 – Colorstripe Phase and Advanced Cycles Position Measurements

II. NTSC Progressive Scan Waveform Measurements

Table 7 – 525p-AGC Copy Protection Waveform Measurements

III. PAL Interlaced Waveform Measurements

Table 10 - End of Field Back Porch Pulse Measurements (PAL)

IV. SECURITY TESTING

Standard and System BIOS Security Tests (PC-DVD)

Capture Video-In Testing – Pass Through Video and Record Capability Tests

## I. NTSC Interlaced Waveform Measurements

## **H-Sync Amplitude Normalization Procedure:**

| Using the Macrovision Test Disc select colorbars with no ACP; loop the video signal through the VDA, |
|--|
| through the Waveform monitor CH-A, then into the Sony cross pulse monitor CH-A, and terminate        |
| using 75 ohms. You should now be viewing the colorbars on the Waveform monitor and Sony cross        |
| pulse monitor Channel A.   |

Using the variable Gain adjustment on the VDA, normalize the H-sync pulse amplitude of the NTSC colorbars signal for 40IRE; verify that the peak white amplitude is 100IRE. *Note: If after the H-sync pulse is normalized to 40IRE the peak white is not 100IRE, then use the H-sync pulse only and verify 40IRE amplitude level.*

### IV. **Security Testing**

## **Standard System BIOS Security Tests:**

| With a copy protected DVD title playing, disable TV-out using the Display Properties menu and select LCD. Then enable TV-out and verify that Macrovision ACP is still present on the output. Repeat this step for VGA mode (switch form TV-out to VGA, then back).  |
|---|
| Install a Type 0 (no copy protection) DVD title; disable TV-out using Display Properties. Install a copy protected DVD title and play. During DVD playback enable TV-out using the Display Properties menu, and verify Macrovision ACP is still present on the TV-out.  |
| With the copy protected DVD title playing, use the Display Properties to disable TV-out but, do not except change, and therefore allowing for the 15 second time out to occur and the system to switch back to TV-out automatically. Verify that ACP is still present on the TV-out port.   |
| With the copy protected DVD title playing, enable sleep mode with a 2 minute "Screen Saver" setting, and a 3 minute "Turn Monitor OFF" setting. Allow system to go into sleep mode and turn off monitor, then wake up the system and verify that ACP is still present on the TV-out port. <i>Note: Most commonly the screen savers will be shut off when the DVD Navigator is launched; this is the safest method to insure security.</i> |
| Install Type 0 (no copy protection) DVD title, play title until movie studio Logo appears, hit pulse, then eject, install a copy protected title, play. Verify AGC pulse present on TV-out.   |
| With TV-out enabled and with ACP present on the analog output, use the "Fn Fx" Hot Keys to switch between LCD, VGA, then back to TV-out. Verify ACP is still present on the TV-out. <i>Note: The Hot Keys used for this option are different on most model Notebooks: i.e. Fn-F6, Fn- F7, or Fn-F5 etc</i>  |
| Using a copy protected disc and with TV-out enabled, verify that when the Eject button is enabled, the ACP on the output is removed. <i>Note: The standard rule is that when copy protected material is present on the output, then ACP should be present: inversely when non-copy protected video is present on the output, then NO ACP should be present on the output.</i>   |
| Install system into Docking Station and verify that when playing a copy protected title, ACP is present on the analog video outputs (if applicable).  |
| Go into Display Properties and select PAL video standard. Using the Macrovision Test Disc, verify that when ACP Types 1, 2, or 3 are selected, the ACP type on the output is Type 1. Note: This verifies that the APS trigger bits are being interpreted correctly for PAL mode: since there is no Colorstripe for PAL mode ACP Types 2 and 3 are interpreted as Type 1.  |

## **Capture Video-In Testing:**

|      | Company Name: Model Name:  |   | el Name:  |  |
|------|--|---|---|--|
|      | PRINT NAME   | SIGNATURE   | TEST DATE                                       |  |
|      | With the video output enabled, playback the file "Type 0" and verify that if the system did capture this video, there is no ACP is present on the output when played back for this non-copy protected material. Repeat this step for the remaining three copy protected files and verify that if they system captured thes files, then the appropriate ACP type is on the video output during playback. <i>Note: The Standard DVD License Agreement section for "Capture Devices" gives the following three options when capturing copy protect material: A) Shut down record when copy protection is present; B) Pass the copy protection signal through the Product transparently; C) Detect and apply the trigger bits to a device that activates ACP on the analog output.</i> |   |   |  |
|      | Install and play a non-copy protected DVD disc in the source DVD player. After the Studio logo is displayed, enable capture for 1 minute and save this file as "Type 0." Repeat this step for DVD discs with ACP types 1, 2, and 3 saving these files with the appropriate file names.   |   |   |  |
| _    | <b>ure Mode</b> : The following tests a<br>lutions less than or equal to 480   |   | resolutions 480 X 320 or greater; capture of e. |  |
|      |  | nove the copy-protected video from the input and verify that the ACP on the output is removed. e: The rule is that with non-copy protect material on the video input there should be no ACP copy tection on the output. |   |  |
|      |  | opy protected DVD material and verify the video at detect circuitry (IC). See Notes above.  |   |  |
|      | Install an ACP Type 1 copy protected DVD title into the source DVD player, and verify that the video output has copy protection present. Note: If the detect IC is capable of detecting 2-line and 4-line colorstripe as well as pseudo sync pulses, then the output ACP should follow the input (i.e. $T-1$ in $= T-0$ out, $T-2$ in $= T-2$ etc). Otherwise, when copy protection is detected on the input, ACP Type 2 should present on the video output.   |   |   |  |
|      | Enable the video output port, launch the capture software to be shipped with this platform, connect the output of the DVD player to the video input on the platform; play a ACP Type 0 (non-copy protected) DVD title and verify that there is no ACP present on the video output.   |   |   |  |
| inpu | ut, on the video output port; full s   | screen or otherwise.  |   |  |

Pass Through Mode: This mode refers to the setup that allows you to view material present on the video
